

TOPOGRAPHIC SURVEYS

A topographic survey is primarily concerned with noting the natural and man-made features on the surface of the land. These may include hills, ledge outcrop, streams, trees, fences, buildings, utilities, and other improvements on the property or site.

Most of these measurements are taken either with a survey quality GPS unit or a robotic conventional survey instrument. The resulting plan will show contour lines, improvements, and all existing conditions of the site. Herrick & Salsbury, Inc. has all the tools necessary to perform these services for you.
